

Shadow Resume Project – Phase 3: Resume Builder (Model + CRUD)

1. Create the `resumes` app:

```
$ python manage.py startapp resumes  
Add 'resumes' to INSTALLED_APPS in settings.py
```

2. Define Resume model (resumes/models.py):

```
class Resume(models.Model):  
    user = models.ForeignKey(settings.AUTH_USER_MODEL, on_delete=models.CASCADE)  
    full_name = models.CharField(max_length=100)  
    headline = models.CharField(max_length=150, blank=True)  
    summary = models.TextField(blank=True)  
    skills = models.TextField(blank=True)  
    education = models.TextField(blank=True)  
    experience = models.TextField(blank=True)  
    projects = models.TextField(blank=True)  
    certifications = models.TextField(blank=True)  
    created_at = models.DateTimeField(auto_now_add=True)
```

3. Migrate:

```
$ python manage.py makemigrations resumes  
$ python manage.py migrate
```

4. Create ResumeForm (resumes/forms.py):

```
class ResumeForm(forms.ModelForm):  
    class Meta:  
        model = Resume  
        exclude = ['user', 'created_at']
```

5. Create Views (resumes/views.py):

- resume_list: Show all resumes for current user
- resume_create: Create new resume
- resume_update: Edit existing resume
- resume_delete: Delete a resume

6. Create URLs (resumes/urls.py):

```
path("", resume_list, name='resume_list')  
path('create/', resume_create, name='resume_create')  
path('update/<int:pk>', resume_update, name='resume_update')  
path('delete/<int:pk>', resume_delete, name='resume_delete')
```

7. Create templates/resumes/:

- resume_list.html
- resume_form.html
- resume_confirm_delete.html

8. Secure views with @login_required and filter by request.user.

■ Successfully added Resume CRUD functionality for each user.

Next: Phase 4 – AI Integration (Skill extraction from resume content)
